I have a problem that involves the error I receive when attempting to complete the asp.net web application example (Walkthrough: Creating a Web Application Using a Third-Party Business Object). When I first create the SQL connection in VS.NET 2003, I test the connection and everything works fine. However, when I attempt to run the first stage of the app (the bound datagrid), I receive an error stating:

login failed for user 'DELL340\ASPNET'.

There was another post in this newsgroup on this subject (Difficulty connecting to SQL Server 2000:2002-03-04) that suggested placing the line:

```
<identity impersonate="true" />
```

in the Web.config file but when I run the app again, there is the following failure message:

Login failed for user 'DELL340\IUSR_DELL340'.

How come the user changed and where did the user name come from?

What can I do to fix the problem?

I appended the full text of the second error message. System is Windows XP, SP2. MSDE server.

Ed.
