Hi,

it seems that you are using Forms Authentication and want to redirect from a login page to another one after a successful login – Am I right ?

In that case, set the Authentication mode to "Forms" in Web.Config, set the forms authentication attributes (LoginUrl, name etc.), set Authorization settings, set default.aspx as your start page, and then in your codebehind do whatsoever mechanisms you want to use to authenticate.

You don't have to manually redirect, Forms Authentication will do it for you automatically. And finally, smartnavigation is all about maintaining scroll positions, element focus etc. for IE 5.5 and above browsers.

HTH
Joyjit
