Hi Ian,

Wish I had good news for you. On a Windows XP Pro box and a Windows Server 2003 box, we loaded your page into IE, and it would not submit. We loaded it into Netscape on the same (XP Pro) box, and it worked. If you got it to work on an XP Pro box, you might want to check the version of IE that it is running. I'm beginning to think it has something to do with IE6.

Unfortunately, the amount and complexity of the JavaScript generated by the Page validator controls was too large for us to spend the amount of time debugging it to identify the exact cause of the problem. It seems odd that you are not among a large group of people that may be having this same problem on IE with ASP.Net page validators.

I'm just wondering here, but it could have something to do with Service Pack 2 and IE 6, or just with IE6. But again, I haven't heard anything about issues with these. On the other hand, we don't use the built-in ASP.Net validation for our apps.

Another alternative is, what version of ASP.Net are you using? If the problem lies with IE6, it could be due to using ASP.Net version 1.0, which came out prior to IE6, rather than using ASP.Net 1.1, which came out after IE6. Just guessing here.

I hope that someone who has experience with this issue can help you further.
