Hi Brian,

I've tested the page you provided and did find the problem. Also, I think bruce's suggestion is reasonable. Since the problem seems occur everytime the page is first time loaded, and after that , the footer's position will be ok. I've done some tests on my side and you may have a try on the following code:

```
=====
<html>
  <head>
    <link rel="stylesheet" type="text/css" href="main.css">
    <script language="javascript">
      function bodyLoad()
      {
        document.getElementById("footer").className="#footer";
      }
    </script>
  </head>
  <body onload="bodyLoad()">
    <div id="container">
      <div id="banner">
```

.....

```
=====
```

That manually reset the css classname for the footer <div> when the page's body is loaded.

BTW, as for web form page, I think it'll be better to use relative position mode rather than absolute position. Also, if possible, I suggest you consider using html <table> element to structure the page's layout, that'll be more flexible.

Thanks.

Regards,
