if you use smart navigation, javascript changes the dom on the fly, so the source is not changed on postbacks (which happen in a hidden iframe – which in turn is generated by javascript – for which you can see the source). you need to use a dom inspector to see the changes made by smart nav.

the html for validator is also generated by javascript (when you click a submit button), so you can not see them is the source. to see the source look in webuivaldation.js the strings themselves are store as attributes off of dom nodes and you can see them in the source.

| Why does IE not show the full html source when I try to view the source??

I

| mean why does it hide a few features.

|

| Previously I had an issue where the data grid html representation was hidden in the source view. After spending a LOT of time troubleshooting this, it was due to the smart navigation setting.

|

| Now I can't see the html for the validators error messages. It's getting pretty irritating to work around IE's quirks and its non standard way of conforming to web standards.

|

| Now I have an IE add-on to show full source.

|

| What are the best ways to make VS produce more browser compatible html?

|
