In theory, NTFS should be marginally (but pretty much unnoticeably) slower, but in the real world the tiny performance hit is vastly outweighed by the benefits you gain from enhanced security,

I would never advise deploying a website on a FAT volume

Does the file system being used by the O.S. (i.e. FAT32 or NTFS) play a major role as far as executing ASP.NET applications are concerned? Or in other words, does the NTFS file system enhance the performance of ASP.NET applications?

Thanks,

Arpan
