Here's an interesting one that has me stumped. I have several ASP.NET applications written in VB.NET that stopped posting back on click of a button. Nothing has changed in the code or the environment, it just stopped working. Here's my config:

Production:

ASP.NET 1.0

.NET Frameworks 1.1 SP1

Win2K SP4 all hotfixes applied, IIS 5.0

Dev:

ASP.NET 1.0

.NET Frameworks 1.1 SP1

Win2K SP4 all hotfixes applied, IIS 5.0

Compiling workstation:

ASP.NET 1.0

.NET Frameworks 1.1 SP1

WinXP SP2, IIS5.1

VS.NET 2003

If I publish the application to my development environment, it works fine...publish to production, and nothing happens. Tested with browsers: IE6.01, IE5.5

My first instinct is to find what changed, but nothing has been done to either environment since applying SP1 of the framework.

I've tried rebooting, reinstalling the Framework, reapplying SP1, recreating the application in IIS... no change... I'm out of ideas and the knowledge base doesn't seem to have anything.

Any ideas?

Here's an interesting twist... it's only the VB apps... C# apps, at the moment, are behaving.

microsoft.public.dotnet.framework.aspnet: applications not posting back
