you will need to do a ticket system. you can link because a cookie can not be shared between domains, you will have to pass the ticket to site. this means you can link between sites without requiring a new login, but if the users hit the site directly, they will be prompted for a login.

you can use a common webservice (like ms passport) to handle the comon login verification and ticket.

| Hi,

|

|

| We have 3 different web applications on three different websites (and
| domains). Now we want to make it possible for users to login in each of
| these applications and can navigate to other applications without
| authenticating. So generally we need to have a shared session across
| applications (a single sign-on).

|

| Whenever a user logins in each application a session identifier is created
| and is saved in the cookie for that session.

|

| 1. Is there any chance to create cookies for other applications
| (websites) at the same time (login time in one of the apps)? So when user
| navigates to other sites, other server can read the session information
| from
| cookie?

|

| 2. Is there any other approach that we can use to have single sign-on
| capability through our sites?

|

|

| Any advice is appreciated.

|
|
|
| Thanks

| Masoud
