If you did that, you're bound to have problems.

For example, both of the portal you have now will be using the same database for everything they do, so you are going to have a lot of conflicting data.

I'd recommend that you delete the virtual directory you created for the site you copied and delete the directory where you copied it afterwards.

Then, reinstall the second portal, using the Portal kit setup, and (if my memory serves me right) use a different name for the 2nd portal's database.

I honestly don't remember if you can do that (use a different name for the portal's database) but most MS sample applications allow you to do that.

Make sure you use a different virtual directory name, too.

Then, and only then, will you not have conflicts between your first portal and your second portal.

Good luck!
