Hot fix for what? Having the same symptoms as someone else doesn't mean you have the same disease. Generally speaking, this doesn't happen. Thereofre, it must be caused by something else (other than ASP.Net). If, indeed, you have "trimmed my page down to barebones and still the issue occurs" you might want to check other software and/or services running on the machine. The most likely candidate would be anti-virus software. But it might also be some other security-related software, or even something else altogether, such as a hack attack (give me a few hours and I might be able to think of a half-dozen alternatives).
