Our server just went down...what might be causing this?

Our site is built on .net and connects to a MS SQL database on another server.

We're having a really odd problem. Our DB connection is down. So, SOME of our aspx pages load up fine, but are missing the content that we usually grab from the DB. The particular error is this:

Error accessing Database.
Timeout expired
Microsoft OLE DB Provider for SQL Server

OR this:

No error information available: E_FAIL(0x80004005).

On top of this, some (but not all) ASPX pages can no longer be 'found' by IIS and redirect to our 404 page.

Any idea of what might be going on? To make things even odder, we can run the entire site locally on our machines, connecting to the exact same DB server and everything is fine. We've rebooted both servers, and still the same error.

We're stumped.
