I don't see what difference you make between point 1 to 4 and the later scenario (not clear if you used submit before using the back button).

IMO :

– if something is wrong I would redisplay the whole form with the error message so that the user doesn't even have to use the back button. Keep in mind that you would rely here on a client side behavior that the user could have altered (by changing its IE settings).

– for now I have the behavior you described in point 1 to 4. Could it be a problem with your cache ? I would try to add a date/time information to the page to see if the page with blank fields comes from the IE cache or if IE gets it once again from the server. It could be also a IE settings. For now it looks like that when you using the back button, IE gets the page again (AFAIK it was also the behavior on old IE releases, which version are you using).

Good luck.

Patrice
