Here's what we do; if the session has expired or doesn't exist we redirect to a "timed out" page. The timeout page contains only a couple lines of javascript to pop up a box alerting the user that they have timed out then redirects them back to the login page. We check the session on every page to make sure it still exists.

in each page:

```
-----  
If Session("User") Is Nothing Then  
    Response.Redirect("../TimedOut.aspx")  
End If
```

timeout page:

```
-----  
function window_onload()  
{  
    alert('Your session has timed out. Please log back on.');    top.location.href = 'default.aspx';  
}
```

I'd also like to hear what other people are using to see if we could change our method to something better – or if this is the norm.

Thanks!
Michelle
