Andy:

My understanding is that it depends on the type of authentication you are using. The CredentialCache is used to store login credentials for multiple resources.

This issue was addressed in the June, 2005 Web Q&A section of MSDN magazine. Please see the following link for more information and a code sample.

Hi,

I'm writing a small c# app to test response times of specific pages of a website. What I need to know is when I make the request to a restricted page can I pass an authentication cookie that all ready exists on my hard drive rather than go through a whole login process to capture the cookie? I suspect that this isn't an option but it would save me a whole world of time if it was.

Thanks in advance for any help, Andy

.
