I'm a newbie to this so please excuse the level of question. My question is how can I dynamically create a table in the middle of a page without having to build the entire page dynamically? I have code to build the string that will generate the table. (This is all to solve the problem of when a person clicks a checkbox in a datagrid, there's no way of knowing what record it belongs to – see my previous post)

Here's what my code would look like ideally:

```
<html>
<body>
<form>
```

Isn't this a pretty page?

(Some kind of code that would build all the controls I need. Ideally this code would be a function that is in the codebehind page)

Done creating my stuff.

```
</form>
</body>
<html>
```

Thanks again in advance.

Jeffrey.
