When testing on my local machine, the session_start fires fine. I try storing a value to my database, creating a timestamped text file, and writing a line of text to a general log file. All of these work. When I transfer my site to my webhost, all of these no longer function within the session_start. All of these functions work correctly when triggered by button clicks or page redirects, the session_start simply won't fire. I have 3 other sites hosted with this same company, and I do the same type of things in each of these sites with no problem. Right now, just to check if the event is getting fired, I have the session_start attempting to convert the letter "S" to an int32. Again, breaks locally, has no problem on my webhost.

```
protected void Session_Start(Object sender, EventArgs e)
{
    Convert.ToInt32("S");
}
```

Any ideas are greatly appreciated?
