What your goals are would be helpful to tell you the best way to approach this. Do you want to authenticate via NT challenge or otherwise?

- 1- Define manipulation. Once authenticated the username is available
- 2-4 not in my realm of knowledge at this time
- 5- to the best of my knowledge, security is on the file, not portions of a file

: i want to implement authorization with windows authentication and don't  
: have the slightest clue of how to do this implementation.  
the basic  
: windows authentication for this .NET application is already setup. my  
: problem lies within my inability to manipulate the username captured in  
: the authentication process and my knowledge of how IIS is involved.  
:  
: specifically, i have the following questions:  
: 1) what object(s) can be used so that the user's username can be  
: manipulated for the authorization process?  
: 2) in order to apply roles, do the users need to be placed in groups in  
: IIS? if so, how does this work?  
: 3) is all the code that the application uses for roles in web.config?  
: or does global.asax play a role in this matter?  
: 4) does the web.config file know to communicate with IIS

Re: AUTHORIZATION with WINDOWS AUTHENTICATION -- HELP!!

because the  
: authorization type is set to windows?  
: 5) once authorization is in place, can a section of an  
..aspx file be  
: visible to a group or can only entire files be secured for  
a group?  
:  
: as you can see, i'm trying to figure out the relationship  
between  
: authorization and windows authentication so any help would  
be  
: appreciated.  
:  
: thanks,  
: john
