

Causing a page refresh mid-method?

I've got a situation where I would like to make a label control visible whilst a few-seconds long process runs, something along the lines of "Please wait...". At the moment this all occurs inside the postback section of the page load event as:

```
private void Page_Load(object sender, System.EventArgs e)
{
if(!this.IsPostBack)
{
<...>
}
else
{
<...>
labLookingUp.Visible = true;
string postcode = g.LatitudeLongitudeToPostcode(lat,lon); // The long
running process!!
labLookingUp.Visible = false;
<...>
}
}
```

But no page update occurs between the Visible = true and Visible = false, resulting in the control never becoming visible to the user. Is there any elegant way around this? Cheers.

.
