hi there,

my app needs to retrieve a value from a previously viewed page. The user moves between pages on the site with the server.transfer method doing the legwork. This works fine.

The problem comes from getting values from a particular page; which does not use the server.transfer command. This page is for logging in, and is the page a user is redirected to when accessing the site. They are redirected there by the web.config file which uses forms authentication. As the logon page uses the line

```
FormsAuthentication.RedirectFromLoginPage(string userName, bool  
createPersistentCookie);
```

to redirect the user; the parameters of the logon screen are not saved from the class meaning i cant access them. What would be a sensible way to get round this ? I need it passed securely as i want the password; so posting it in the url is out.

I thought to authenticate the user then direct them to a specific welcome page. How/Can this be done whilst satisfying the web.config file for authenticating a user.

Any help greatly appreciated,

H

.
