I have fetched a query in to the datagrids. Now I have added a new column to the existing table (to the datagrid.)

In the new column I have placed 2 buttons. So when I click the first button it performs some set of instruction. I actually made use of this procedure DataGrid1\_ItemCommand.

```
Private Sub DataGrid1_ItemCommand(ByVal source As Object, ByVal e As System.Web.UI.WebControls.DataGridCommandEventArgs)
End Sub
```

Now my question is how will able to use the other one? coz when I double click the second button, it is nowhere land me in to a new procedure..

Let me know you thoughts..

.
