I am developing a thick client and a web client for a piece of functionality for my website. The main class lives in a thick client app and has ongoing development done to it. I would like to use that class in my web app. How can I do it? I would like to be able to reference the project in case I want to debug into the class, and also be able to deploy the release version when I copy/deploy to the server.

Is this possible?

Thanks.
