Hi Paul,

The text box was an example of displaying the data. The data is the variable "timeLeft." The function decrements the variable and displays it (in this case) in a text box. How you display the value of the variable is up to you. In other words, I didn't intend for you to simply copy and paste it. Apparently, you pasted it into the <head> section of your document. I'm not sure why. In any case, an "input type=text" text box belongs inside a form. A script can be anywhere in an HTML document.

Just use that Software engineer inside you to take my example, and create your own implementation of it, based upon the principles illustrated, and of course, obeying the rules of HTML.

You can lead a fish to a bicycle,
but it takes a very long time,
and the bicycle has to *want* to change.
