Hi Dan,

Welcome.

So the problem seems due to the file share communication between your WIN 2003 server and WIN XP work station (dev box). Make sure the server share has grant sufficient permissions (grant everyone sufficient permission) to exclude permission problem...

And from the kb article, it indicate that there could be some problem related to the SMB communication since windows NTFS File share use SMB protocol to communication... And I think the limitation could be at the XP box side... To check this, I'd suggest you find another win2k3 machine as client dev box (which have vs 2005 installed) to try opening the file shared web project to do the same test.... If that can work, we may pay further attention to the setting for XP box....

Thanks,

Steven Cheng

| Hi guys

| Okay, I've setup my projects to open and compile fine in VS2005 using
FPSE
| and remote web, but it's *really* slow. So I thought I'd have a go at
doing
| it the normal way, by loading from the network share.

| It loads in VS2005 fine, and I can edit and save code changes etc, but
when
| I try and Build the solution, I get the following error...

| An error occurred loading a configuration file: Failed to start monitoring
| changes to 'W:\sitename\classfiles' because the network BIOS command
limit
| has been reached. For more information on this error, please refer to
| Microsoft knowledge base article 810886. Hosting on a UNC share is not
| supported for the Windows XP platform.

| So, I'm using XP Pro on my development machine, and Win2k3 Standard on
the
| server. I've read the article mentioned and edit the dev machine registry
as
| suggested, restarted everything, and it still gives me the same error.

| Help! What can I do to get this working?!

| Cheers

| Dan
