A couple of weeks ago I reported a bug in vs2005 where it corrupted projects converted from vs2003 if a 2003 dataset were modified or recreated. Steven Cheng [MSFT] was able to recreate the bug. I reported the bug and Steven said he was also going to report the bug.

>From a practical standpoint this bug prevents migration of projects from vs2003 to vs2005 because if 2003 dataadapters and datasets can't be changed, any large project is unmaintainable. In other words it's a really really bad bug.

Is there a way to find the status of this problem? when will it be fixed? Unless I'm willing to manually convert over 700 2003 dataadapter : dataset pairs to 2005 GridView : ObjectDataSource : Datasets the vs2005 product is useless to me (and I just forked out 2 grand for an MSDN license to get it).
