Use cryptography functions to encrypt and decrypt data in the querystring. This is what I use:

<http://www.willasrari.com/blog/index.php/2006/01/17/csharp-encrypt-decrypt-database-passwords/>

I originally used that tutorial to encrypt the password to store in a database. You can just as easily edit it to encrypt/decrypt the querystring, username, id, etc...

It's in C# but converting to VB.NET shouldn't be too difficult.

Thanks, I'm using c# so that's fine.
