Ok, but in the other application, there is no aspx page, just libraries. So in the App\_Start i want to retrieve some variables. Can I send params to App\_Start event on th global.asax?

Thanks

I might be wrong, but I do not think you can do this. If you think about it, how can you store something an a variable for an application that does not exist yet. Not to mention, I don't think you can have on app interface with the memory of another, they are different AppDomains and, just like processes, are isolated.

Why can't you just pass them using the querystring and process them during the Init or Load events?

Hi group. I have 2 web applications. I start the first application with a default.aspx page. On a button click, it makes a reference to another application. I want to store 3 variables in the click event of the button and read this 3 variables in the Application\_Start event on the second application. How can I do it?

Greets.

Genaro
