Pass the selected values back to a function on the calling page

```
//Calling Page
function myChildHanlder( valueForAction )
{
//Take some action here with the value passed to me
//Usually pass this to a hidden field
__doPostBack();
}

//On Child Form

window.opener.myChildHandler( theValueToPassBack );

//In Asp.net
On PreRender event, look at the hidden field and act upon it.
```

hi all,

when a user click a button on 'parent' page, then 'child' page pop-up and
get
focus. When user select data from two dropdown box (or other controls),
then
they click submit button at 'child' page, then the 'child' page closed
itself

Re: ass values between two pages

and return values to 'parent' page (two textbox).

How can I do this in JavaScript? The reason I am using JavaScript because other programmers web apps will also call my 'child' page too.

Thanks in advance.
