Hello,

I have a site which I've been developing locally with VS2k3 Pro. I have some browsercap information in my web.config to help identify Firefox as an upscale browser. It works great locally. Labels render as labels and so on.

However, when deploying the site onto a different server, all my Labels render as <span>, even in IE. I don't understand what's going on, I haven't had this happen to me before. What discrepancies between the configuration of IIS (or whatever) could exist between my local machine and the server? As far as I can tell, I've copied everything over to the server including the web.config with the browsercap info. I might have expected this to happen with Firefox if I failed to update the remote web.config, but the fact it's happening with IE is totally stumping me.

Any ideas as to what's going on?

The Labels render as <span AssociatedControlID="foo">bar</span>. The local development machine is XP Pro SP2 and the server is Win2k SP4.

Thank you for any advice!

Garth
