I forgot to mention that I've looked at WindowsTokenRoleProvider. This works great for looking up if a user is part of a group. However I was looking for managing roles for the groups. e.g. Edit role, View role, Delete role

It sounds like you want AzMan, or authorization manager. ASP.NET includes an AzMan role provider, and then you would use the activedirectory membership provider.

AzMan allows you to specify complex operations, tasks, and groups. This way, you can say Members with the "can edit foozles" operation can enable that button (though this requires a little bit of work to make work right).

AzMan comes with Windows 2003, and you can install it in XP or Windows 2000 by downloading it.

It doesn't seem to be available unless your AD is 2003.
