Since I never seen the following question answered, I am re-posting it:

Hi

Im using ASP.NET 2 with C# in codebehind files and Visual Studio 2005 Team Edition.

I have embedded lots of XML Documentation (<summary>,<see>,etc) into my ASP.NET project in code behind files of ASP pages, user controls and classes in the App\_Code directory. I have added the "/doc" compiler option using the web.config (see snippet at bottom of post).

When i build my website it seems to only generate the XML documentation for one file only.

Is there a way to generate all documentation for the web project?

Also if i give the full path to the /doc option i can find the output but if i just give a file name i dont know where it creates the file.

Has anyone ever had any success with XML documentation of web projects? Let me know if there is a work around that im missing on the web.

Thanks  
Ben Crinion

```
<system.codedom>
<compilers>
<compiler
language="c#;cs;csharp"
extension=".cs"
type="Microsoft.CSharp.CSharpCodeProvider"
compilerOptions="/doc:c:\XMLDOCS.xml"
warningLevel="1" />
</compilers>
</system.codedom
```
