As far as I know, all libraries will run under the same version of the framework as the application that is calling them.

I have .NET frameworks 1.1 and 2.0 on the same server. I am going to create a class which I will compile as a separate DLL to be used by a number of different applications. I want the DLL to use the 2.0 framework even if it's being called by a program running under the 1.1 framework. How can I force the DLL to use the 2.0 Framework.

Thanks,

Mark Zeiger
