Juan,

The setting in web.config affects compiling .aspx files deployed on the server. It doesn't affect assembly dlls produced in a development environment and deployed to the server as binaries.

I should have added that, in ASP.NET 2.0, the debug/erelease choice is set via the web.config file for the application :

```
<compilation debug = "false">  
or  
<compilation debug = "true">
```

The default is "false".

Eliyahu,

In VS 2003, that choice is available. In VS 2005, it's not.

Right-click your solution in the solution explorer and select the  
Configuration Manager. You should also see a dropdown list with word  
Debug on your standard toolbar.

When I tried debugging for the first time, I pop-up asked me if I wanted  
to set the project to enable debugging. Now I'm ready to release and  
can't find anyplace to set the build to 'release'. A pointer would be  
appreciated. Thanks.

Joe
