I see that it works if you are a local admin on your workstation.

Possibly you have have configured your normal user account to not accept cookies or scripting, so session information can't be persisted.

Perhaps add this site to your IE "safe" list. Check your browser settings under Tools/Internet Settings. Compare those settings between you and as an admin.

And the .NET framework mentioned is on the server, not your workstation. This is a server error, keep in mind.

At any rate, your vendor has unhandled exceptions (poor coding)

um... i don't have access to the code. it's not my website. the site is a vendor of my company's and they keep telling me that my pc is the problem.

Jeff Dillon wrote:

Your call to the stored procedure is failing, because you are not passing the correct number of arguments (like the error says)

Search your code for sp_MW_tblDeals_Update_Main_Finance and see where/how the parameters are set.

Then open SQL Enterprise Manager, and drill down to this stored procedure and open it, and look for the parameters it's expecting

Jeff

hey... i know NOTHING about sql server, .net framework or

Re: desperately needing help with a Server Error

probably
anything

[quoted text clipped – 59 lines]

there
was the correct location. ***
