I followed this thread thinking – wow! this is my problem...

I've got the following...

- A web.config that appears fine
- An application that I compile with no errors – repeatedly
- A virtual directory where the application has been created

I get the message cannot load type XXXX.Global...

If I change my codebehind directive to src I get XXXX.Global is not defined in the file specified – when it clearly is and was never touched.

If I try to load default.aspx and remove the codebehind and inherits from global,asax, I get cannot load type XXXX._default, which is the class name for the default page.

If I migrate the solution to another machine and setup a virtual app – I get the same issue; thus ruling out an issue with IIS – I think.

Can anyone think of what the problem might be? Please remember, it was running fine and then not. This is urgent as I'm on a tight deadline with currently a dead solution.

Thanks,

– Nick

yes!!! that was it!!! thank you! I've been racking my brain for 3 days now...trying to figure this out. That article helped a LOT! If you have any other suggestions for articles/books on learning asp...I would really appreciate it. I'm VERY new to all this, and sort of got thrown into it without much foundation. (I'm a biologist...turned IT at work).

Re: Parser error

Take a look at :

<http://www.dotnetjunkies.com/Tutorial/3623050C-B046-4E7B-A2C7-0934F1105312.dcik>

"The Inherits attribute MUST be used with the Src attribute."

You are not using the Src attribute.

You should be using something like :

```
<% @ Page Language="VB" Inherits="biopsy.SampleSearch2"
Src="SampleSearch2.aspx.vb" %>
```

Mind you, the correct Page statement will depend on what which source files for that Inheritance you're using.

A better alternative would be to compile your source files into an assembly, and referencing *them*.

Sorry if this gets posted twice, it gave me an error when I tried to reply. Anyway, yeah...they're all under Biopsy. I've checked the namespaces. What I did was bring back an old version of the project, and copy in the files I need from the new version. Now I can get past the login page (the first error), but still am getting this second error when I try and access the page:

Parser Error

Description: An error occurred during the parsing of a resource required

to

service this request. Please review the following specific parse error

details and modify your source file appropriately.

Parser Error Message: Could not load type

Re: Parser error

'biopsy.SampleSearch2'.

Source Error:

```
Line 1: <% @ Page CodeBehind="SampleSearch2.aspx.vb"
Language="vb"
AutoEventWireup="false" Inherits="biopsy.SampleSearch2"
%>
Line 2: <!DOCTYPE HTML PUBLIC "-//W3C//DTD
HTML 4.01 Transitional//EN">
Line 3: <HTML>
```

Source File: c:\inetpub\wwwroot\biopsy\samplesearch2.aspx
Line: 1

Version Information: Microsoft .NET Framework
Version:1.1.4322.2032;
ASP.NET
Version:1.1.4322.2032

This is what is at the top of my SampleSearch2.aspx page:

```
<% @ Page CodeBehind="SampleSearch2.aspx.vb"
Language="vb"
AutoEventWireup="false" Inherits="biopsy.SampleSearch2"
%>
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01
Transitional//EN">
<HTML>
```

Any more ideas? I've tried including/excluding the pages
from my project,
and it still results in the same error. Thanks!!

What is the namespace under which all these
pages are built under? Is it
biopsy? Can you make sure you got it right
in your code behinds?

Hi,

I keep getting the parser error, and I have no idea why. I've tried a number of things including:

- 1)building/rebuilding about 100x
- 2)making sure all dll's are in the bin folder in the root of the web app
- 3)restarting IIS
- 4)recreating the virtual dir in IIS
- 5)playing with any and all settings I could find for the web app in IIS, including changing permissions
- 6)recopying the machineconfig file from my asp v1.4... onto my local

server

from the production server (just in case the file was corrupt).

- 7)plus random other things that I can't remember off the top of my head.

I've been working on this problem for 2 days. can someone PLEASE help

me???

this is what I get if I set my webapp's login page as the start page:
Parser Error
Description: An error

Re: Parser error

occurred during the parsing
of a resource
required

to

service this request. Please
review the following
specific parse error
details and modify your
source file appropriately.

Parser Error Message:
Could not load type
'biopsy._default'.

Source Error:

```
Line 1: <% @ Register
TagPrefix="uc1"
TagName="menu"
Src="menu.ascx"
%><% @
Page Language="vb"
AutoEventWireup="false"
Codebehind="default.aspx.vb"
Inherits="biopsy._default"%>
Line 2: <!DOCTYPE
HTML PUBLIC
"-//W3C//DTD HTML 4.0
Transitional//EN">
Line 3: <HTML>
```

Source File:
c:\inetpub\wwwroot\biopsy\default.aspx
Line: 1

**If I change the start page
to just the main menu page,
then when I
try

and

go to my search page from
the main menu, I get this
error:
Parser Error
Description: An error

Re: Parser error

occurred during the parsing
of a resource
required

to

service this request. Please
review the following
specific parse error
details and modify your
source file appropriately.

Parser Error Message:
Could not load type
'biopsy.SampleSearch2'.

Source Error:

```
Line 1: <% @ Page  
CodeBehind="SampleSearch2.aspx.vb"  
Language="vb"  
AutoEventWireup="false"
