I am getting a strange situation with a .NET 1.1 web application that we have deployed. I have made an update to a code behind page in 1 file, and then made an update to another code behind page. After that I rebuilt everything. This is all on my dev server. Now I move the 1 code behind page and the updated dll to the live server. But I did not move the other code behind page to the live server. Now somehow I am getting an error on the live server that is referring to the updated code behind page that has NOT been moved to the live server. How is this possible? How can it error out on code that hasn't been made live yet?

Thanks,

Chris Green
