The SQL for the tableadapter needs to use the IN operator as in
WHERE job_id in (111, 222, 333, 444, 555)

How do I specify that it is rather an array or list of numbers,
essentially passing an array of numbers to the parameter?

Pass it as a string. Then let the stored procedure that returns the data,
parse out the individual items.
There are some issues with this approach....

Search google groups in comp.databases.ms-sqlserver. I remember Erland
Sommarskog (or something like that) has a HP about this specific problem.
