Hello. Maybe someone can help me.

My development computer has: WindowsXP SP2 and MSSQL Server 2000 and IIS 5.0(or 5.1)

Our webserver has: Windows2003 SP1 and MSSQL Server 2005 and IIS 6.0

We are storing sessions in MSSQL Server 2005

My description.

I dont have any problem, the problem is at webserver.

I have some project, that i upload to webserver when i updated some code. Everything fine for now.

Last time i made a lot of changes in code, so i wanted to put in web-folder copy of real project. This copy will be in another folder, and for this "copy-project" i created separate database. Its just copy of real project, i just changed database name in web.config

Of course these 2 projects have same name for their dll in bin folder.

For example myproject.dll.

So, these two dll were started in one time. I am storing some serialized objects in Session. And user's entered data are stored in these objects.

The symptoms are:

Entered data (by user) not shows.

For example. I have the page with frames. User can go through pages like Windows's tabs. When user load this one "tab", controls must be filled with user's data, which he entered earlier. But all fields are empty.

BUT! I began to have same problem with live project when i started test project.

I think there is the problem with two sessions. i think they are intersect each other, and this is the cause why i am receiving no data from Session object.

How to solve this problem ? I dont want to loose any session variable in both projects.

and also i want to start them at one webserver, just in separate folders and separate databases.
