Hi,

i am a newbie on web development...

i have developed a little file download app (asp.net fw 1.1 Sp1). I use Response.TransmitFile to send files to the client. On my win2000 server (iis5) everything works fine.

Now on the win2003 server (iis6) the browser window freezes when i start a download. refreshing the page has no effect until the download finished.

When i open a second browser window with an new session i can access the app normally also during download.

It seems to me that there is only one connection or thread available for one session. Is this possible? Any hints?

(btw.: i'm a newbie in this forum too... how can i search the forum?)
