I have this in my web.config file:

```
<system.diagnostics>
```

```
<trace autoflush="false" indentsize="4">
```

```
<listeners>
```

```
<add name="myListener" type="System.Diagnostics.TextWriterTraceListener"
initializeData="C:\\temp\\guestpulls\\Guestpull.log" />
```

```
<remove name="Default" />
```

```
</listeners>
```

```
</trace>
```

```
</system.diagnostics>
```

In my Code, I have the line:

```
Trace.WriteLine("Initialize(): Hello!");
```

Nothing gets logged to my log file on the remote server.

(On my local box, it works)

You were talking about Tracing though – whether it works or not – if you

Re: TRACE doesn't work on the remote box

want to do tracing, it needs to be turned on somewhere
You can do it inside the web.config file, or you on each web page where
you
want tracing. For instance, you can turn it off everywhere (completely) in
the Web.config, but enable it in the page directive in your web page.

The same code works on my box.
I haven't changed anything while deploying to the remote server.
Where do I check that anyways?

Have you got Trace turned off anywhere (like in your
Web.config, or in
your
page?
