As far as I know, in VS 2005, the website projects are run on an in-built web server and do not go to IIS till they are "Published".

I am not sure if you can send it to IIS while still developing it, I guess you can keep publishing every so often to view it, its pretty fast process. But I have a feeling that you can make some changes (by downloading and installing some add-on to VS 2005 from MS) that will allow you to do website development in VS2005 in VS2003 style. Try googling for it (sorry, I couldn't be more specific).

Regards,
V

i just noticed the website i created in VS 2005 is running on a different port than the default. I see that it is running on the local web server, and also that the website i created isn't in IIS.

My crystal report looks weird because it is trying to show images from the crystalreportviewers10 virtual directory based on the current website running, which in this case is localhost:1169, but actual the crystalreportviewers10 virtual directory is off of just localhost.

What can I do in this situation to make my images to appear?

Can i change it to use port 80 and will it work?

thanks
