I can't change the domains, im not an admin and there are too many users to warrant that change.

As for the problem function – the problem is that i cant send out messages to Tibco Rendezvous. The function works ok usually.

Hi,

I'm having problems with authentication.
I have a set of users that are allowed to use a webpage. They are in domain A.
My goal is to get the username of these users and then check them against my list.

The webpage is hosted under a username in domain B.
I cannot change any settings on the domains.

This means that i cant use windows authentication because of the different domains.

I've tried to use basic authentication, but then a secondary function that the webpage fires off doesnt work for some reason (i havent found out why because i cant debug in my VS under basic auth!).

Is there anyway else to do it?
At the moment the authentication is set to anonymous but the username is set to the same username the webpage is hosted under.

Re: Authentication Q – Cant use basic or windows

Thanks
