- 

I have a dataset with a table "Artikler". Before I bind the table to a DataList in my Web Form I want to update the value of each row of the field "PreText" in the table. (I don't want to update the database only the local data of the DataSet Table) I want to replace all the occurrence of chr(13) with the <br> tag.

01 myDataAdapter.Fill(myDataSet, "Artikler")

02 code for running through the table and update the field "PreText" for all rows

03 DataList1.DataSource = myDataSet.Tables("Artikler")

04 DataList1.DataBind()

I need some help filling in the code of line 02
