No doubt you will have to store these in a hidden field if you don't want to use a lot of Ajax here. As you said you don't want to attach this to a button. So here's an example of handling a return value such as in `confirm(message)`, and using those values in server side code.

<http://www.codeproject.com/aspnet/ClientServerInteraction.asp>

Hi all,

Can any one direct me in how to use javascript `confirm()` function when a condition is met from codebehind. I don't want to attach this to a button. When I submit the page, I want to check some business rules, and based on the response from the database, if the response is Yes, I need to display a confirmation alert to user. When the user clicks ok, then I should take an action, if not, exit out of the subroutine.

Below is the script I'm using in the `Submit_Click()` subroutine.

```
If Trim(Message) <> "" Then
Dim strScript As String = "<script
language=JavaScript>"
strScript += "confirm("" & Trim(Message) &
""");"
strScript += "</script>"
If (Not
Page.IsStartupScriptRegistered("clientScript")) Then
Page.RegisterStartupScript("clientScript",
strScript)
End If
End If
```

In the above code, I'm getting a message from the Sql database into Message variable, and showing that to the user.  
But I don't have a way to track what an user have selected from the confirmation alert box.

Any help is appreciated.

Re: Javascript Confirm()

Thanks.
