Sure you can -- check out this code sample at ASPNet101.com:

<http://aspnet101.com/aspnet101/aspnet/codesample.aspx?code=GridViewCheck>

Once the checkboxes are checked -- then, you can create a function/sub to go through each row, and for each one that has a checkbox actually checked, you can do anything you want to or for that row.

Hi,

I am trying to create a ASPX page which will list items with a checkbox beside each. The user has to be able to select items using the checkbox to do some further processing. If I use a gridview control, the checkboxes are all disabled, and I find that I have to have a Edit button for each row, and after clicking the Edit button, the row checkbox gets enabled.

Is there any way that I can use the Gridcontrol (or any other ASPX web control) to display items with enabled checkboxes without having the user to click on Edit button before he can check/uncheck the checkbox?

Or should I have to use inline scripts to generate the items and checkboxes? Any sample codes available.

I really appreciate any help in this.

Re: Enabled checkboxes in gridview control

Thanks,
