websites don't have project files. just add a vdir pointing to the file dir, drop the site from the solution, then add the site from iis.

We created a "File" website on XP and transferred it over to server2003. Now we want to change it to an HTTP site. Without creating a new project and importing everything, is there a way to convert it? the properties show file:///C:/Inetpub/wwwroot /etc. but it can't be changed to HTTP. It's got to be somewhere in some configuration file.
