Guys,

I'm unsure how to use windows authentication in an intranet application. I'd like to user existing windows account to identify users however the issue I have is how to then add settings to those users and map them to roles.

If I'd like to restrict the windows users which log on and what tasks they can perform in the application how should I do this? Presumably I'd need one user to log in initially and perform admin type tasks e.g. assign windows users permissions to use the application, how should I do this? How do I create the first user who can log in?

Best Regards

Matt
