Hello Juan.

Thanks for your reply.

I did what you said and it worked until I went into the Web Site Administration Tool.

There has to be something else that is wrong, because this was not happening before and I've used the Web Site Administration Tool plenty of times before.

Thanks,  
Tony

The warnings are caused by this line in web.config:  
<configuration  
xmlns="<http://schemas.microsoft.com/.NetConfiguration/v2.0>>

Remove the xmlns part so only:

<configuration>

remains...

The warnings will not show up.

The "xmlns" part is added when you use the Web Site Administration Tool.

Hello.

Trying to develop ASP.NET Web Application Project using Visual Studio  
2005.

SP1, Web Application Projects 2005, .NET Framework 2.0.50727.42,  
ASP.NET  
2.0.50727.210, in Visual Basic on a Windows XP Pro, SP2 computer.

I developed a lot of it by using the excellent tutorials by Scott  
Mitchell  
at <http://msdn2.microsoft.com/en-us/library/aa581770.aspx>

I am having numerous problems.

I guess the main problem is that when i open my WEB.CONFIG file it  
displays  
63 errors similar to the Message "Could not find schema information for  
the  
element  
[http://schemas.microsoft.com/.NetConfiguration/v2.0:configuration'."](http://schemas.microsoft.com/.NetConfiguration/v2.0:configuration'.)

All 63 errors refer to the same schema information. The weird thing is  
that  
the program runs anyway.

Another problem is When i put a control on a form, running the program  
does  
not display the control where it is placed on the form. If two controls  
in  
design mode are positioned exactly at the same location from the top of  
the  
form, when i run the program, the controls are positioned differently.  
If  
the Tools/Options/HTML Designer/CSS Positioning/Positioning Options is  
set to  
"Absolutely positioned", then why is it not working?  
How do i get it to display at run time the way it is positioned at design  
time?

Also, Scott Mitchell's tutorials showed how to develop your web  
application  
with a STYLES.CSS file. It seemed to work OK when i first started adding  
controls to a form, but now when i add a new control, it doesn't seem to  
pick  
up the same style pattern as the first controls did.

Another problem. I have a LOGINSTATUS control on a form, and it has a  
property LogOutPageURL, but does not have a LoginInPageURL. I'm trying

Re: Several problems with ASP.NET 2.0 Web Application Project

to  
make it so that when the user clicks on it, it takes them to a LOGIN.ASPX  
form. When i run the program and click the LoginStatus control, it gives  
an  
error saying it can't find "/LOGIN.ASPX". I have a Login.aspx, but it is  
in  
a folder called "Login". I guess it can't find it because it is not in  
the  
main project folder. How do i tell it to look in the Login folder?

Any help that anybody can provide to resolve these issues would be  
gratefully appreciated.

Thanks,

Tony
