Unless the email is also the user name, or you are using a custom profile provider, you are not pulling up the user. You can test this in debug by setting a breakpoint here:

```
pc.FirstName = MemberFirstName;
```

See if you have an object that is filled with your user.

The signature for Create is UserName, not email, so check this.

Hello,

I am using asp.net20 membership. I have some properties in web.config

```
<properties>  
<add name="FirstName" type="System.String" allowAnonymous="true"/>  
<add name="LastName" type="System.String" allowAnonymous="true"/>  
<add name="JobTitle" type="System.String" allowAnonymous="true"/>
```

```
</properties>
```

in my update profile code i have

```
ProfileCommon pc =  
(ProfileCommon)System.Web.Profile.ProfileBase.Create(Membership.GetUser().Email,  
true);
```

Re: Profile not saving

```
pc.FirstName = MemberFirstName;  
pc.LastName = MemberLastName;  
pc.JobTitle = MemberJobTitle;  
pc.Save();
```

I dont get any errors and nothing gets saved. When the member first registers and enters these profile fields they are captured and saved however when user later tries to update they cannot.

Anyone any ideas.

Thanks in advance.

Ismail
