I set up a linked connection to it and it worked fine. the lock file appeared as well.

If I open up the database the lock file appears and the query shows all the records it should.

In which case, you need to apply the Sherlock Holmes logic which says that, once you have eliminated the impossible, whatever is left (however improbable) must be the answer...

If you have a web page which should be querying a Jet database but, when it runs, the corresponding locking database doesn't appear and the Last Accessed date of the Jet database is not updated, then at that precise moment it isn't querying the database – it just can't be, however improbable you find this to be...

If you rename the database immediately prior to accessing the page in question, what happens...?

.
