Is there a way to obtain user information (using LOGON\_USER server variables) when you have set up the security to Anonymous Access?

No.

I have tried setting the security to both Anonymous + Window Integrated, without any luck. I'm using IIS 6.0 on Windows Server 2003

That ought to have worked, so long as:

- 1) you have a Windows domain
- 2) your IIS machine is part of that domain
- 3) your client machine is part of that domain
- 4) your client browser is IE
- 5) your client machine is actually logged on to the domain, i.e. the user hasn't logged on locally...

Other scenarios may also work, but the above certainly should...
